Work-readiness of Indian graduates: A multi-stakeholder approach to assess competence deficits, causes and possible solutions

Introduction

Graduate work-readiness refers to the extent to which graduates are observed to acquire skills and attributes that provide them with the ability to succeed in the workplace, and is increasingly being perceived as suggestive of graduate potential in terms of their job and career performance, and advancement (Caballero and Walker, 2010). Preparing work-ready graduates is now seen by extant research as a major role of higher education (Green, Hammer, and Star 2009; Holmes 2013; Tomlinson 2010; Tymon 2011). As a construct, graduate work-readiness has become an important benchmark for making decisions relating to graduate recruitment and selection (Caballero et al., 2011). Accordingly, universities have engaged with the graduate employability agenda by re-examining what attributes their graduate should hold, and by focusing on imparting those skills that might make the students more appealing to employers across various industries and sectors (Bridgstock, 2009). Although several studies have been undertaken on how graduate readiness and employability varies across various countries and their labour markets, the majority of those studies have been conducted from a developed country perspective (see Andrews and Higson, 2008; Dacre Pool and Sewell, 2007; Montague, Connell and Mumme, 2018). On the contrary, scant attention has been given towards researching and understanding graduate employability and work-readiness in developing countries (Tran, 2012) including in less developed countries (see Bhanugopan and Fish, 2009). Although some studies from developing countries do exist, they have mainly looked at employability from an international student mobility perspective; such as Chinese students in the UK (Huang, 2013).

This chapter explores the issue of graduate employability and work-readiness from an Indian perspective (Edakkandi Meethal, 2014). India is one of the foremost major developing countries in the world (Budhwar, 2001). It ranks second, after China, in producing the largest number of STEM (science, technology, engineering and mathematics) graduates in the world (McCarthy, 2017). This should be considered positive given India's demographics – that it has a young growing population of 25-50 who are seeking white collar jobs (Khare, 2014). However, despite this accomplishment, Indian graduates constantly struggle to get hired in the local labour market.

For example, according to a report by the Wall Street Journal (2011), about 75% of technical graduates and more than 85% of general graduates are deemed unemployable by India's high growth industries. Although India has one of the largest education systems in the world, the employability of its graduates has remained one of the foremost challenges for the country (Khare, 2014). As a result, this has impacted the transition of Indian graduates into their careers and the role they play in the labour market. A good supply of skilled and employable graduates is essential for national, economic and social well-being, and the failure to equip graduates with employability skills has far-reaching consequences (Wickramasinghe and Perera, 2010).

This chapter presents a comprehensive picture of work-readiness and employability among Indian graduates transitioning from university to careers in the Indian labour market. More particularly, it presents macro and micro data from various industry sectors in India to chart the dimensions and trends in graduate work transitions in India. Furthermore, the chapter presents an empirical view of three main stakeholders' (policy makers, employers and educational stakeholders) assessments of the work-readiness competence deficits of Indian graduates and their possible causes. Finally, it discusses recommended solutions by these stakeholders for making Indian graduates work-ready.

Dimensions and trends in Indian graduates' work transition

Although the number of graduates with higher qualifications in India has been steadily increasing, the number of graduates unemployed also remains relatively high. Accordingly, more and more graduates are registering themselves at the employment exchange in the country, and major shares of these are those who are educated (Khare, 2014). For instance, according to a report by the Labour Ministry in India, one in every three graduates up to the age of 29 is unemployed with the total employment rate being close to 12% (Sharma, 2014). Accordingly, this has brought the problem of quality and employability of graduates in India to the forefront as the gross enrolment rates (GER) in higher education in India reached 21.5 percent for the year 2011-12 (Mehrotra, 2015). As such, there is a significant problem that India is likely to face in the future due to the lack of utilisation of its graduates which will likely lead to major challenges associated with human resource skills and knowledge in the country (Priksat, Kumar and Raje, 2018).

Interestingly, the Indian economy registered a high gross domestic product (GDP) growth rate during 2015-16 and is showing strong signs of growth in industrial and service sectors (ILO, 2016); thereby, indicating that the country is ready to tackle the issue of the high levels of unemployment of its graduates. However, data indicate that this complex problem is far from over, as approximately 146 million of the workforce (of 485 million) in India was illiterate in 2012 (Mehrotra, 2015). As illustrative examples, over 253 million of the labour force possesses education qualifications at secondary level, but only 15 million have tertiary level technical education which includes graduates with certificate or diploma-level qualifications (Mehrotra, 2015). A recent report by the All India Council for Technical Education suggested that over 60% of students graduating from technical institutes remain unemployed (India Infoline, 2017), while only 7% of graduates in top business schools are considered employable (The Economic Times, 2016). Accordingly, there is a massive disconnect in the Indian education system between the demand and supply of graduates for employment resulting from the lack of work-readiness skills among university graduates (India Skills Report, 2017).

Macro vs. Micro Trends

Although India today remains one of the fastest growing economies in the world, a major drawback of its labour market is that the majority of its graduates, generally (?) has been trained informally in their industry (Khare, 2014; 2016). For instance, in the agriculture sector, the most dominant source of informal training is hereditary (family businesses operations) sources, while in the manufacturing sector training is conducted on-the-job and among the ones who are trained – i.e. 86% in agriculture and 91.7% in the manufacturing sector - are those that have received no formal training (Khare, 2016). On the other hand, there is a high demand for highly educated and formally trained employees, but it exists primarily in the fast-growing service sectors of India. For instance, information technology (IT) companies in India prefer hiring engineering graduates who bring with them strong analytical and technical skills including high levels of proficiency in problem-solving skills (Gokuldas, 2010). Accordingly, it is the service sector of India that employs highly educated and formally trained workers and graduates, amounting to 60% of jobs in India (Khare, 2016; Yang, Partlow, Anand and Shukla, 2014). Table 1 provides the employability rates for 2015 and 2016 as per the qualifications gained by Indian graduates; whereas Table 2 shows the employability proportions between males and females in India between 2014-2016.

(Insert Table 1 & 2 here)

Concerns about lack of work-ready graduates in India for domestic and international labour markets have sparked calls for reforms in its higher education system (Carter, Marmolejo and Spaid, 2016). Other observers have noted that there is also a need to change the curriculum in the Indian higher education system to tailor it more closely towards the requirements of industry-employer expectations (Chithra, 2013; Gopalakrishnan and Sukmar, 2013). Industry can also play a major role in shaping and reforming the Indian higher education system. For instance, some private companies in India such as in the IT sector now require potential candidates to sit for, and complete, aptitude and other skills-based tests to determine their work-readiness (Salmi, 2017). However, a level of disappointment persists among employers and industry in the Indian labour market regarding the lack of graduates' work-readiness competencies and skills.

A key industry within the Indian higher education is the vocational education and training (VET) sector which has been the blind spot for central and state governments in India for the past six decades (Gupta, Raman and Krisanthan, 2016). According to a world bank report on skill development in India, there are massive problems in the Indian vocational education that relates to the lack of private and industry participation in the management of institutions, their curriculum, lack of funding model and a significant mismatch between the demands of the industry and the courses offered by VET institutes and colleges (World Bank 2008). Furthermore, from a societal perspective, the Indian society has always traditionally seen the VET sector as suitable for those students who are academically poor (Kumar, 2009) and this has created challenges for the planning and reform of this sector. The aim of VET sector in India is to create employment opportunities and imparting suitable skills for generating self-employment, especially in rural and unorganized sector (Agrawal, 2013).

Higher education policy reforms

The Indian labour market has seen persistent policy reforms which have caused concern for policy makers and industrialists alike (Majumdar, 2016). The Indian government's policy initiative for altering its education system reflected the shift in its economic ideology that includes an increasing reliance on market forces by emphasizing on liberalization and with several national committees being established since 1980s to provide recommendations, ideas and policy proposals (Cloete et al., 2006). However, the main issue with the Indian higher

education system is the lack of policy implementation, which lies in its failure to manage the trade-offs involved in pursuing various projects; such as not taking into account the institutional changes or not suggesting concrete measures for mobilizing resources (Cloete et al., 2006). The Indian education system starts with primary, secondary and higher education with higher education starting after passing the 12th standard which leads to five years of graduation and two to three years of post-graduation (Gupta, Raman and Krisanthan, 2016). Furthermore, the higher education system in India can be classified into three categories; namely, universities, colleges, and special institutes offering diploma courses (Venkatram, 2016). Although there are several public universities in India that are funded by the country's University Grants Commission (UGC), there is also a major presence of private institutes offering specialized courses.

Presently, the Indian government is making efforts to improve its higher education system by implementing key macro initiatives to accelerate graduate work-readiness; namely, 1) adopting a public-private partnership model, 2) forming sector councils and the adoption of schools by the private sector, and 3) encouraging the private sector to participate in quality assurance systems (Majumdar, 2016). In addition, changes are also being made through curriculum and examination reforms, and universities have adopted a semester system whilst providing English language courses at the undergraduate and postgraduate level (Khare, 2016). With the aim of enhancing graduate skills to capitalise on the demographic dividend (young labour market), the Indian government launched a comprehensive National Skills Development mission and an Inclusive Skills policy in 2009 to promote institution-based graduate skill development (Khare, 2016). As such, an industry-wide approach and a shift from quantity to quality can be seen in all the reforms undertaken by the government of India to improve higher education.

Moreover, several important initiatives have been undertaken at government level to root out work-readiness concerns for graduates. Following are the details of some important initiatives:

- The Technical Education Quality Improvement Project (TEQIP-III) project signed between Government of India and the World Bank aims to improve the quality of engineering education across several states at a cost of US\$ 201.50 million to be implemented in a 3-year period until 2020.

- The All India Council for Technical Education (AICTE) has taken various steps to improve technical and higher education in line with the Central Government's initiative ('*Digital India*' and '*Skill India*').
- Four new schemes – '*Unnat Bharat Abhiyan*' - for engaging with communities and using technologies for their upgrading; '*Trainee Teacher Scheme*'- recruitment of fresh graduate engineers as well-trained lecturers for the NIT's, '*Adjunct Faculty Scheme*'- to have a strong and robust collaboration between the educational Institutions and industry, and '*Margdarshan or Mentorship scheme*'-mentoring to institutes by a well performing Institute, have been launched to enhance the work-readiness of graduates.
- Other initiatives embarked upon by AICTE include *mandatory internships* for students (4-8 weeks during summer vacations), *training of teachers* (both induction and annual in-service training), *single entrance examination* for admission in undergraduate engineering programs, and *induction training* for first year students (PCM, English, communication skills, ethics, values).
- *Regular revisions of curriculum* (annual feature); *industry interaction cells* in each institute; promoting innovation in study and startups; *exam reforms* with more emphasis on practical subject understanding and skills than mere subject knowledge; and *preparing perspective plan* for the country with inputs from all the states.

Graduate work-readiness stakeholders

Sin and Neave (2016), discussed the interpretations of employability from the perspective of policy-makers, academics, students and employers. Similarly, extant research has reported numbers of stakeholders in addition to the education stakeholders - employers and industry groups, government and policy makers, students and their parents/ families (Crossman and Clarke, 2010; Harvey and Shahjahan, 2013; Jackson, 2014; Kinash et al., 2016; Tran, 2015; Walkington, 2014). Different stakeholders may perceive work-readiness competencies differently in variable contexts (Tran, 2015; Williams et al, 2016) resulting in inconsistencies between the perceived value and outcomes for students/graduates (Jackson, 2014; Kinash, et al,

2016; Male and Chapman, 2005). It is important for all stakeholders to realise and develop a mutual understanding of the challenges and to work collaboratively to enhance the work-readiness competence of graduates (Kinash et al., 2016; Tran, 2015). Based on the above discussion, this chapter examines the work-readiness competence deficits of Indian graduates, the causes of these deficits, and possible strategies and solutions to improve them from the perspectives of three stakeholder groups; policy makers, employers and educators.

The following research questions guided the study, based on graduate work-readiness (GWR) literature:

1. What are Indian graduates' requisite work-readiness competence deficits?
2. What are the causes of these deficits?
3. What possible strategies and solutions are appropriate to enhance Indian graduates' work-readiness?

Method

This study used a multiple design process of data collection and analysis involving three stakeholder groups - policy makers, employers and educators - to contrast their views on Indian graduates' work-readiness status, causes and possible solutions. A qualitative research design was used to gain some preliminary insights and help shape future research. In-depth, semi-structured interviews were conducted to gain insights from the key stakeholders. Data generated were analysed in two stages according to key themes (Clarke and Braun, 2013; Hesse-Biber and Leavy, 2011). The researchers first examined each case on a stakeholder basis and used their experiences, insights and descriptions through words and written texts to find a pattern and themes in the meanings as discussed in the interviews (Creswell, 2013). The transcriptions of the recorded in-depth interviews were analysed, followed by open coding and axial coding through close examination of the data; then aggregate themes were sought and subsequently reviewed, and for reporting purposes these themes were defined and named. Particular quotations from interviewees are also presented, following conventions in qualitative research, throughout the main text to provide additional data to support our collated analysis in Table 4 (Pratt, 2008).

To obtain data for the best possible information twenty-two participants in total, well placed to provide expert commentary on the current state of graduates, were selected. Due care was taken to include respondents from academia who had more than ten years' experience and were aware of the current work-ready issues faced by the graduates. The industry respondents comprised CEOs, managing directors and senior executive managers who were struggling with finding work ready graduates, and had formulated various strategies in their industry to meet this challenge. Most of the government respondents were involved in policy making initiatives concerned with higher education. Of this sample, six responders were policy makers, eight were industry/employers and eight senior representatives from education sector. (See Table 3 for more details). Semi-structured interviews were conducted with the respondents in the vicinity of the NCR (National Capital Region), Dehradun & Chandigarh in India during June and July 2017. These cities are education hubs and contain the offices of most of the well-known organisations in India.

(Insert Table 3 here)

Research Findings

The following table (4) outlines the various competence deficits identified by these stakeholders in Indian graduates.

(Insert Table 4 here)

It is evident from the Table 4, that there was a consensus among all the stakeholders regarding the deficiency of soft skill competencies in recent Indian graduates. Communications skills of the graduates were main area of concern for all the stakeholders. Policy makers were specifically concerned about practical orientation of graduates, whereas employers reported that the graduates were deficient in team-building and interpersonal skills also. The educators noted that graduates are not committed and dedicated enough to go through the courses in a much planned approach, so as to meet the demands of workplace requirements.

Following section covers the work-readiness competence deficits identified by all the three stakeholders, their causes and proposed solutions in detail.

1. Policy makers

1.1 Work readiness competency deficits

The key concerns raised by policy makers for the appropriate work-readiness of Indian graduates were in the competencies of practical orientation (being practically-oriented towards accomplishing the tasks) while gaining an employment and communication skills of the graduates. Communications skills, especially English-speaking skills were also highlighted as deficits in recent graduates. Policy makers also noted that graduates coming from remote areas usually lacked the communication skills and professionalism needed for the twentieth century work-culture. This also explained the lack of confidence of these graduates as they are not fluent in English, and usually they are required to correspond and to some extent speak in English for brighter career prospects. Competencies of innovation and conceptual understanding were also reported as a deficit by the policy makers.

1.2 Causes of competence deficits

The main cause observed by policy makers for their lack of practical orientation was attributed to the fact that most of the universities'/colleges' syllabus and teaching practices are more theoretical in nature and practical exposure relating to the industry is not provided to the graduates. This situation is further worsened with outdated syllabi that have no connection with the practical needs of contemporary industries. Following are the observations of one of policy makers regarding the old and obsolete syllabus:

“...is providing the syllabus, which is very old and doesn't conform to the standards of industry. Going through the course, following these obsolete syllabi, how you can train the graduates for the industry”.

Moreover, policy makers also noted that the universities/colleges also suffer from a resource problem even if they want to develop the infrastructure needed for grooming students for industry. The policy makers also put some blame on graduates, as they observed that graduates are not willing to contribute back to the educational institutions. Those graduates who excel in their studies and are successful in organisations usually don't contribute back to their alma mater in any way.

For the lack of communication skills and subsequent loss of confidence in graduates, the policy makers touched on the sensitive issues of national and regional languages. The medium of some

graduate courses in regional languages, instead of English, was also pointed as a possible cause for a lack of communication skills:

“So if you are talking in a national language one should not feel shame in speaking national language starting from top to bottom level. But in India, if you see, extreme south people may not be knowing Hindi, when you come to the extreme north, the top official will only be comfortable in Hindi”.

The ministerial system or minister responsible for education was another factor which was brought up by the policy makers. They were quite apprehensive, considering that education portfolios are often run by ministers who are not educated themselves. This fact made their all efforts to increase the work-readiness of graduates redundant, as the ministers without any formal education don't understand their proposed innovations in the educational institutions. Following are the observations of one of the policy makers:

“Our education reforms largely depended on government systems. These systems are being ruled by ministers, who may be educated and who may not be educated. So obviously, such persons, if you are guided by such persons who don't know anything, so obviously they may not be able to understand these efforts because they don't have the requisite calibre”

The colleges affiliated with universities were also blamed for work-readiness issues. It was mentioned that though these colleges go through the accreditation process and regulation processes are in place, but the quality of faculty as well as the quality of teaching offered is sub-standard. Following reflect this view:

“On one hand, we have IIMs, IITs and NITs, and prestigious government universities, we have private universities, on the other hand we have got private universities and colleges affiliated to universities. There is a vast variation in our system education system that lacks consistency. There is a need for robust mechanism to ensure consistency over all these institutions.”

1.3: Strategies and solutions

The policy makers generally favoured revising the syllabi of different courses according to the needs of industry as well as the formulation of more innovative course designs based on the efforts of research and development (R & D) teams in universities and colleges. These teams must be funded by the government bodies and will ensure that state-specific indigenous courses/products can be developed that can cater to the industrial needs in those states. Following is the observation of one policy maker:

“The need is for enhancing the practically oriented infrastructure, through proper funding mechanism with the support of state or central governments so many ne innovative courses/products designed to fulfill the needs of the industry can be started based on the efforts of R&D teams”

Policy makers further observed that to address the work-readiness concerns of graduates, more innovative course curriculum design is needed, and the faculty of universities and colleges should be instrumental and motivated to push that in their respective universities and colleges. Further, this type of initiative should be supported by government through a funding mechanism accompanied by regulations ensuring their accountability. To ensure proper implementation of regulations in affiliated colleges the need for more robust mechanisms and tight disciplinary action for those who don't conform to the regulations were suggested.

To address deficits in communication competence, ways to enhance the role of national language across different states and territories as a common language was emphasised. The policy makers were overwhelmingly in consensus when suggesting that only educated persons should be in charge of education portfolios so as to address the concerns of graduate work-readiness. Following are the observations of one of the policy makers:

“As governing bodies are supposed to make the system, therefore I will say before you assign education portfolio to a person, the ministry must ensure how much that person knows about global education, as well as aware about the present education system in the country”.

2. Employers

2.1 Work readiness competency deficits

The employer stakeholders, while highlighting the existing demand-supply gap in employment, observed that there is perfect competition in the market for recent graduates to get good jobs. It was noted that, it is not that the jobs are not available, but the jobs are there for work-ready candidates and the number of these candidates is comparatively low. Reinforcing these observations, there was a consensus among all the stakeholders regarding the deficiency of soft skill competencies in recent Indian graduates. A majority of them reported that most of the recent graduates employed by them were found to be deficient in communication, team-building and interpersonal skills. Following are the observations of a senior executive from a major organisation which recruits fresh graduates every year:

“Every year, I face challenges in recruiting engineers who are good in soft skills. Almost all the fresh graduates lack basic professional writing skills, they can hardly write emails without making errors, they don’t know how to work in teams and lack basic interpersonal skills”.

Absence of the right attitude, a lack of professionalism and a practical orientation, and lack of appropriate knowledge were other major competencies in which many Indian graduates were found to be deficient. Following are the views of one of the employers:

“They don't have practical knowledge, their basics are not clear, majority of the fresh graduates do not understand what they have studied and what are the implications of that in the industry, so the basic knowledge itself is lacking”.

Some of the employers also reported that they were concerned about fresh graduates’ lack of global knowledge, personal grooming, lack of multi-skills and perseverance competencies.

2.2 Causes of competence deficits

The major causes for the lack of practical orientation and knowledge were attributed to the failure of educational institutions to upgrade and update the courses on a regular basis according to industry needs. The educational institutions were blamed for not investing too much time in building their course curriculum to industry standards, and as well as lack of creativity and innovation in learning and teaching methodologies. Although the employer stakeholders observed that there has been a marked improvement in industry- education interaction, they asserted that more efforts are needed in this direction. Simply put, the students are not given

adequate exposure to industry. Some of the employers mentioned a lack of competition among graduates to get admission in some professional courses due to the competition and mushrooming growth of private educational institutions. One employer observed:

“Initially there were competitive exams for entry into prestigious educational institutes, and only quality students could get into these programs ensuring good quality of graduates. These days the competition level is missing, any candidate can buy a seat regardless of his/her level, thus increasing number of non-work-ready graduates”.

Moreover, it was noted that the employers, in the wake of stiff competition, don't have time to enhance the soft skills of graduates. Another relevant point brought up forward by employers was the lack of employability assessment measures for graduates leaving their institutions. Employers claimed that educational institutions seldom engage with graduates in identifying skills gaps. They felt that they do not seem concerned whether the graduate is work-ready and will be able to cater to the needs of industry successfully. The priority of educational institutions appears to be on attracting the maximum number of candidates and passing them without taking seriously the employability assessment of their graduates vis-à-vis industry needs. Another possible factor that might have contributed to more non-work-ready graduates from the perspective of employers was their parents' role in deciding about career choices of college students. The parents do not seem to appreciate what the college level student is interested in, what are his/her aspirations, but rather force their wishes on their children to undertake studies in those fields in which they have no interest. They don't want to inspire their children to go for innovative and enterprising carriers but recommend their kids to go for more routine professional positions and career opportunities, thus limiting their choices. The employers also felt that many of the graduates who became new employees lack the qualities to survive and prosper in their industry, and were not clear how to progress further in their careers. Note the remarks of an employer:

“Parents have a single agenda of proving in their society that that their kids are studying some prestigious courses, but they don't realise the interest and aspirations of their kids. They simply want to make them engineers or MBA graduates. Most of the graduates when interviewed lack the practical urge to sustain in their chosen qualifications”.

2.3 Strategies and solutions

The employers observed that the education institutions are often not training graduates in soft-skills and consequently many graduates have only academic skills. Following are the observations of one of the employers:

“If we can conduct small projects related to soft-skills, team-building exercises, then why can’t it be done at graduate or post-graduate levels”.

The need for more practically-oriented curriculum comprising internships, industrial visits and industry expert lectures was emphasised. Their emphasis was more on the length of internships (similar to those used in engineering and medical education), where the employers believed that the length of the internships should be around six months at least, so that the students can understand the challenges of their future job descriptions and grasp the details of industry competency requirements. One employer stakeholder observed the following:

“I think the internship duration should be of at least six months for every course as it gives chance to graduates to get connected to perspective employers and it improves the chances of getting the job. This can also generate many references for future job prospects”.

The employer stakeholders observed that this is the time for all the stakeholders to synergise, sit together and talk more frequently to solve the work-readiness issues of graduates. They suggested a need for frequent meetings between industry and educational institutions so that both parties can have the feel of what industry needs. Employers’ roles could include conducting collaborative workshops with education institutions, walk-in lectures from industry experts; and more active roles of key industrial experts in revising the curriculum of different offerings was recommended. Further, the stakeholders proposed that the teaching and learning processes need to be more practical and application-oriented rather than theoretical. Moreover, it was underlined that educational institutions should be aware of the competency needs of the industry in their vicinity and develop graduate skills according to the demands of that industry.

3. Educators

3.1 Work-readiness competency deficits

The educational stakeholders while observing that the knowledge base of students coming into graduate courses (i.e., MBA, Engineering) is very poor, also suggested that the general awareness of most of the graduates is very low. They suggested that the reading and comprehension skills of graduates are poor as they rarely read or go through newspapers and magazines to analyse current affairs. Most of the education stakeholders believed that graduates are not committed and are not dedicated enough to raise their levels to meet the demands of workplace requirements. That is why they get a shock while starting work and immediately put the blame on the education system. These stakeholders noted that most of the graduates lack analytical, decision-making, team-building and problem-solving skills, and are poor in communication skills. Other reported deficiencies in competencies were in the areas of business acumen, right attitudes, aptitude, being agile and ‘street smarts’ and discipline.

3.2 Causes of competence deficits

For the lack of proper analytical, decision-making and problem-solving skills, interestingly some of the educational stakeholders blamed it on the ‘Jugaad’ mindset of most of graduates, where they want to find quick-fix solutions to the problems instead of devoting time and learning the inherent capacity to solve life as well as business problems. Following are the observations of one of the stakeholders:

“I would blame it on the role of home and society on the development of students coming to us who have a ‘jugaad’ mindset. Students want an easy way through shortcuts and without any hard work, thus impacting their critical analytical skills”.

Moreover, partial blame for graduates’ lack of work-readiness was put on parents also. It was noted that the parents were instrumental in the lack of work exposure of current graduates. It was suggested that parents seldom entrust any responsibilities to their children from the early stages, which hinders their abilities to cope with the real world. Most parents will not give a child the simple responsibility to go and buy vegetables or grocery from the nearby store as this is likely to interfere with their studies. Moreover, educational stakeholders observed that in Indian society, working while studying in menial or routine jobs is considered a social taboo impacting the social status of families. Thus, the graduates

become part of a system where they lack work exposure and have only academic learning. Following are the words of one educational stakeholder:

“Parents pamper their kids and don’t encourage them to work while studying, and instead measure their success in terms of marks which they get. This ends up with passing graduates who have higher percentage of marks, but oblivious to work culture needed at industry level”.

Lack of industry-academic interaction also resonated with these stakeholders. It was observed that just accommodating graduates for 2-3 months in the internship program, without close mentoring and monitoring, doesn’t serve the purpose, and industry must contribute more to this important cause.

Another important observation made by one of the education stakeholders in reference to a book by Professor Srikant Datar (2010), *‘Rethinking the MBA’*, was the reason why educational institutions tend to focus on ‘knowing’ dimensions (theories, facts, models, definitions) of learning and to neglect the ‘doing’ (developing the skills, capabilities, techniques which lie at the heart of practice of any field), and ‘being’ dimensions (taking responsibility for executing change, developing depth as a person, considering the balance between a career and commitment towards organisation, understanding one’s own limitations, developing learning attitude) is often missing from the curriculum and pedagogy.

Another prominent factor which was discussed was the absence of work-experienced faculty in many educational institutions. It was observed that most faculty members are academics or researchers and not business practitioners, as required in today’s competitive business world.

3.3 Strategies and solutions

All the education stakeholders were in unison that a systematic and continuous interaction with industry is the key strategy that can considerably enhance graduates’ work-readiness skills. They also suggested that course curricula and pedagogy should be designed in consultation with industry people. More fusion of the experience of academics (having industry experience) along with specialist industry personnel who can enhance exposure to graduates, is an important need.

Further, they recommended that the Indian education system must move away from rote learning and memorisation of concepts and instead focus on the application of theories and concepts complemented with meaningful work-related interventions.

More practical curriculum, intended to increase students' industry exposure, and involving more responsibility and accountability for graduates, must be incorporated in the mainstream educational institutions. Equipping them with lateral thinking and multi-tasking features and assignments will surely add more competencies and produce 'street-smart' graduates.

Following are the observations of one educational stakeholder:

“Today the country wants street smart graduates not professional course toppers. Get the graduates be absorbed in more practical curriculum having tasks involving lateral thinking and multi-tasking features around industrial mainframe duties to make them used to working under pressure with time bound tasks”.

Some educational stakeholders asserted that the admission eligibility and process for some courses (i.e., MBA, Engineering) needed a re-evaluation. It was considered that there is a dire need to assess the potential and suitability of the candidates for professional courses. The emphases during these professional courses must be on developing the analytical and decision-making skills of graduates. Shifts from classroom-based instruction to an industrial-experiential learning system were recommended. Further suggested solutions centred around inculcating team/group assignments and activities in the course curriculum to enhance the analytical and decision-making skills of graduates, and more properly-designed internship programs with suitable time-frames aimed at solid exposure to industry practices.

Another innovative solution offered by education stakeholders was regarding 'inter-disciplinary integrated programs', jointly taught by academics from two or three different disciplines, thus enhancing integrated thinking for the graduates across organisational borders.

Discussion

The empirical analysis based on the observations of all the three main stakeholders showed many similarities concerning the work-readiness competence deficits in Indian graduates, their causes

and recommended solutions. The stakeholders were in unison while observing that Indian graduates are way behind industry needs in terms of the development of soft skills. Extant research has reported that soft skills are an important predictor of employability (Gokuldas, 2010; Lievens and Sackett, 2012; Nickson et al., 2012), and new graduates who demonstrate soft-skills (e.g. effective communication and interpersonal skills) will be more competitive in the marketplace than those who do not (Finch et al., 2013). The results of the empirical analysis show that all the stakeholders are mostly in agreement about the lack of communication, team-building and inter-personal skills in Indian graduates, thus considerably reducing their competitiveness or work-readiness. Often these competencies are considered as a pedestal at the point of appointment (Hinchliffe and Jolly, 2011).

Educational stakeholders specifically pointed out a lack of analytical and decision-making skills in recent Indian graduates. Policy makers and employers also observed a 'skills gap' between conceptual understanding and the practical orientation and application of these concepts towards the job tasks assigned to new graduates. The 'skills gap' concept sees the challenge of the university curriculum to be conceived largely in terms of a bridging of 'the disparity between industry needs and higher education provision' (Jackson 2013, 778). The primary responsibility for employability rests with individual students and graduates (Leong and Kavanagh 2013; McQuaid and Lindsay 2005; Van Buren 2003). Education stakeholders were sceptical of graduates conforming to these responsibilities. Many observed that the recent crop of fresh graduates is not committed, lack agility and lack the capacity to think out of box and are not street smart. The need for them to be proactive in preparing themselves for a changing world by actively improving their knowledge and skills to meet the demands of the modern workplace (Bridgstock 2009) was emphasised. They considered that this ability for 'thinking out of the box' can give them more prominence and provide an edge over other graduate candidates. Employer stakeholders also felt that the graduates lack general awareness and global exposure, and at the same time they are not multi-skilled and are non-responsive to the needs of the business. Policy makers also brought to the attention that the graduates lack innovative skills and professionalism to make a transition to the workplace.

The most prominent reason for these competence deficits was attributed to a lack of industry-education interface, outdated syllabi and course-curriculum, the relatively poor quality of

affiliated colleges, lack of employability assessment, '*jugaad*' mind-set and attitudes of parents. Policy makers put the onus on resource challenges and the failure of alumni to cater to the needs of the educational institutions. Another important observation by policy makers was concerning a lack of communication skills due to the sensitive issue of national and regional languages. With more focus on the medium of education in their graduate courses on national languages, the graduates lack ability to write and converse in good English. Employers do give due consideration to language skills at the point of appointment (Hinchliffe and Jolly, 2011) and similar expectations can be there in the case of Indian graduates. Moreover, they also attributed the cause of the lack of work-readiness of graduates on the ministerial cadre in charge of education portfolios, as most of the ministers are not well-educated and they fail to understand the needs of the current education system.

The sub-standard quality of education offered by university-affiliated colleges was also brought to light by policy makers. Employers were generally unsatisfied by the course-curriculum offered by educational institutions and the lack of creativity and innovation in the content matter and teaching methodologies. Another relevant point made by employer stakeholders was regarding an absence of employability assessment of graduates in their final year of study. The recommendation was for universities to encourage more employer involvement in the selection of employability criteria and for greater employment-based training and experience (Mason et al, 2009). They also held parents responsible for coercing graduates into popular courses without considering their children's aptitude and interest in these courses. Many educational stakeholders felt that most colleges and universities tend to focus on the 'knowing' dimension instead of the 'doing' dimension, and that greater focus on the latter might give an extra edge to graduates to become work-ready. The relative absence of industrial experience of faculty members in many educational institutions was also highlighted by educational stakeholders.

All the stakeholders agreed that it is time to synergise their efforts and discuss these issues more frequently to enhance the work-readiness of Indian graduates. They all recommended a drastic change in course-curriculum of programs offered at graduate levels to meet the practical demands of the industry, as well as greater focus on more innovative and practical course designs. This observation resonates well with Hager and Holland's (2006) observation that academics need to re-design their curricula and introduce new methodologies to enhance

graduate capabilities. Greater employer involvement in curricula design and increased practicum experiences in employment was also suggested, which concurs with observations of Mason et al's study (2009). A more active role of government in creating R&D teams across the ministry and education institutions, supported by sufficient funding arrangements, to boost innovative and indigenous courses (products) was envisaged. They also underlined the role of robust internship programs in all courses with proper time-frames, as in medical and engineering programs, together with frequent industrial visits and industry expert lectures to enhance the work-readiness levels of graduates. Moreover, they observed that admission eligibility processes needed tightening up, so that only quality candidates with the right aptitudes can get entry into professional courses, thus ensuring better quality graduates.

Conclusion

Based on suggestions from literature - that the significant gap which exists between what is provided by the university and what is expected from graduates in the labour market will be best addressed by the support and cooperation between the university and the employer (Artess, Forbes, and Ripmeester 2011; Lowden et al. 2011; Rust and Froud 2011) – this chapter investigates this gap in terms of the work-readiness competence deficits of Indian graduates, and further explores the support and cooperation among the three important stakeholders. Considering that the alignment of subjective work-readiness competencies between graduates and employers is vital for smooth transitions from university/college to work, this study found a range of competence deficits based on the observations of both the stakeholders, from the perspectives of policy makers. In doing so, this chapter develops a foundational understanding and perspective of three main stakeholders concerning competence deficits of Indian graduates, causes and recommended solutions for the same.
